

A detailed 3D cutaway diagram of a particle detector, likely a calorimeter. The diagram shows various internal components, including a central green cylindrical structure, a red outer shell, and several layers of blue and yellow rectangular blocks. A long, dark, cylindrical beam pipe runs through the center of the detector. The background is a light blue gradient.

EMCal Calibration

Jin Huang (BNL)

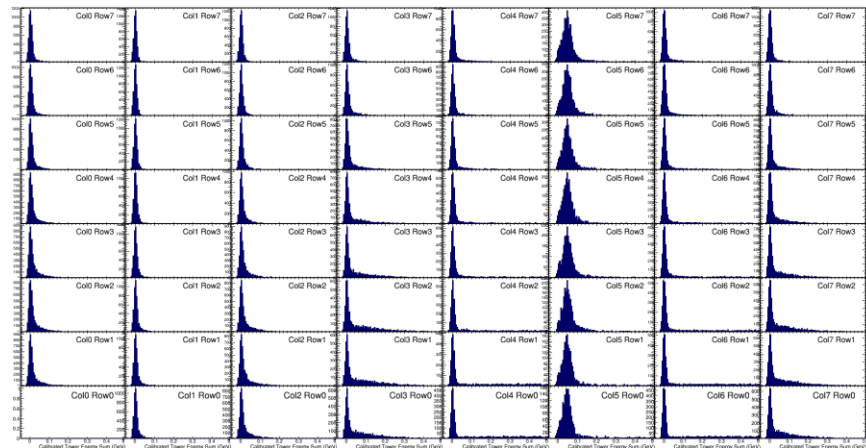

Mike Skoby (U. Michigan)

MIP calibration – the idea in sim.

- ▶ Use 120 GeV proton as high flux MIP proxy
- ▶ Scan through all columns
- ▶ Use as tower-by-tower calibration in production

Rotated to face down for 120 GeV proton calibration

MIP calibration – Data analyzed by Mike

Subset of plots from Mike's Testbeam workfest talk:

<https://indico.bnl.gov/conferenceDisplay.py?confId=2235>

Set 1 (Nose Down Not Rotated)

Set 2 (Nose Down Rotated 180°)

Set 3 (Nose Down Not Rotated)

Set 4 (Nose Down Not Rotated)

Set 5 (Nose Down Rotated 180°)

Set2 and Set4 available
in most recent productions
([more on wiki](#))

Shower calibration – online tests

- ▶ Temperature correction (T0, slope, T)
 - Need event time stamp
- ▶ EMCal – e-shower calibration

Online analysis test, 3x3 hodoscope cut

- Mike S. Set2 MIP calibration
- Further shower calibration

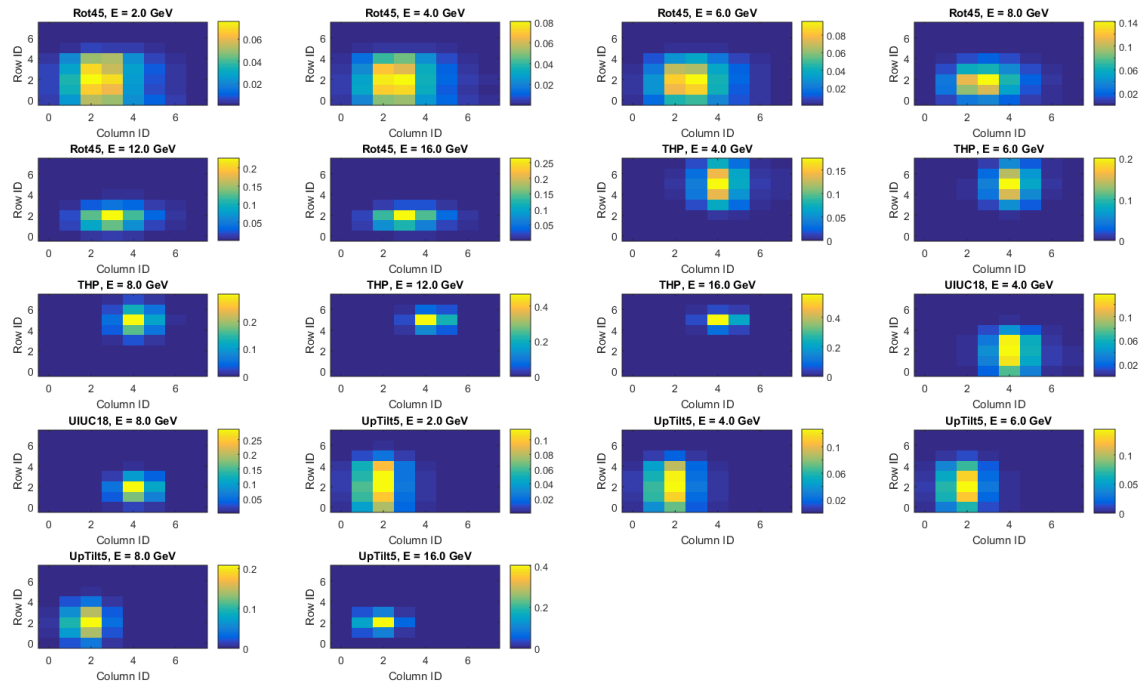

[https://wiki.bnl.gov/sPHENIX/index.php/T-1044/EMCal_good_run_note#First energy scan](https://wiki.bnl.gov/sPHENIX/index.php/T-1044/EMCal_good_run_note#First_energy_scan)

Shower calibration – towards final

- ▶ Use four configurations of detector setup with data sets of various beam energy to cover max number of towers
- ▶ Use temperature correction – quoting number from last presentation of Joey and Martin
- ▶ Analysis modules on GitHub, and special cut for calibration
<https://github.com/sPHENIX-Collaboration/analysis/tree/master/Prototype2/EMCal/ShowerCalib>
 - No hit in veto counter (Calib $E < 15$)
 - Valid single hodo-scope fired in H / V (Calib $E > 30$), accept all 8x8 hodo-scope fingers
 - Electron Cherenkov (sum $c2 > 100$)
 - Temperature is not crazy ($25C < T < 30C$)
 - Energy sum using all 64 towers
- ▶ Calibration code in matlab
 - Objective function = $\text{Sum} ((E_{\text{observ}} - E_{\text{expect}})/\sigma(E))^2$ is minimal
 - Allow energy scale (E_{expect}) to vary from each configuration

Data sets 1 of 2:

Inspect each data sets

Run numbers as linked to wiki

- https://wiki.bnl.gov/sPHENIX/index.php/T-1044/EMCal_good_run_note#Energy_Scan_.280_Degree_tilt.2C_EMCal_rotated_45_Degree.29
- https://wiki.bnl.gov/sPHENIX/index.php/T-1044/EMCal_good_run_note#Energy_Scan_.28THP_centered.2C_Tower_42.2C_70k_Events.29
- UIUC runs centered on block 18
- https://wiki.bnl.gov/sPHENIX/index.php/T-1044/joint_data_good_run_note#Energy_Scan_.28Tilt_up_by_5_Degree.29

Data sets 1 of 2:

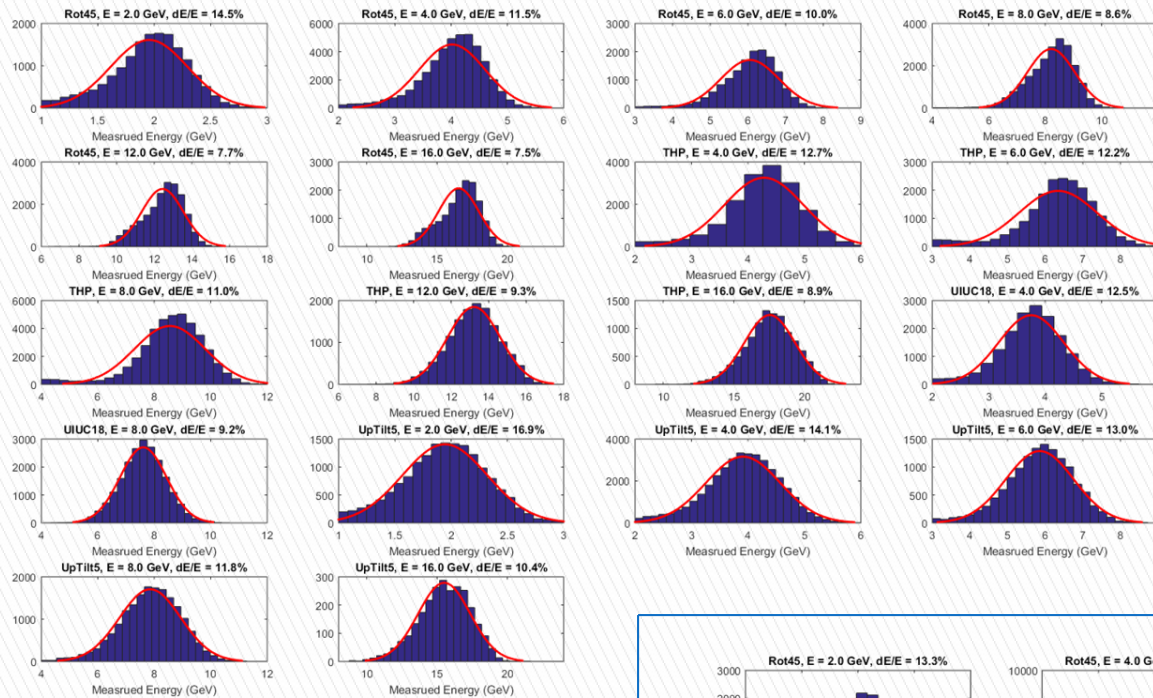

Sum all data sets

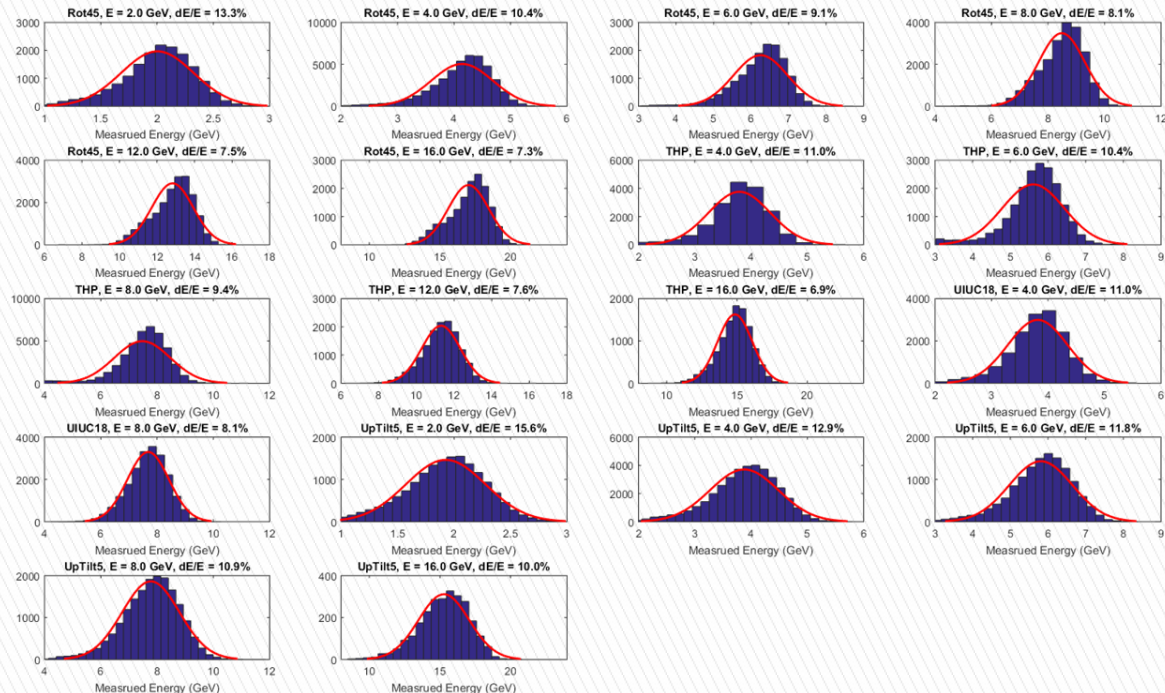

No data on THP
far left

No data on
UIUC far right

A trial run

- General improvement in spread in all data sets
- Significant tail remains for 45 degree tilted configuration
- THP somehow has better over resolution (note accepting 8x8 hodoscope here)
- Not as dramatic improvement for UIUC centered modules

Next...

- ▶ Refine data selection:
 - Reject 12 and 16 GeV data for calibration due to narrow beam spot? (avoid coupling between beam position and calibration)
- ▶ Refine constraints and tail rejections
 - Online calibration: 3 iteration of with tightening tail rejection
 - This trial: 1 iteration without rejecting tails
- ▶ Apply calibration to test production and quantify resolution with analysis hodo-scope cuts
- ▶ Treatment of towers with no calibration data (but used in hadron data)
 - Expect reuse MIP calibration with some average re-scaling
